Nature as a model: in order to survive in the sea, dolphins use echolocation, a technique they have developed over millions of years.

From ideas to innovations

A natural phenomenon in the service of industry

Since the very beginning, humans and animals have used sound as an information medium and as a means of measurement. Bats can locate their position by means of ultrasound. Dolphins can detect shoals of fish and other objects underwater using ultrasonic frequencies of up to 120 kHz, and are even able to determine the heart rates of other animals. Probably the oldest type of sonic measurement used by human beings is counting the seconds between seeing a bolt of lightning and hearing the thunder in order to determine just how near a storm really is.

The idea of exploiting such measuring techniques – albeit very much refined – for industrial purposes led to the development of ultrasonic sensors. These emit high-frequency sound pulses, inaudible to the human ear, and measure the time taken

by the signals to return after being reflected from an object. The robust sensors prove their capabilities in the most diverse applications, particularly through their ability to operate without any contact with the objects being measured or detected. This is even possible under extreme ambient conditions. Also impressive is their ability to accurately detect a vast range of different materials and colours.

It is exactly this huge potential variety of practical applications and the need to overcome traditional performance boundaries with product innovation that have driven microsonic for over 25 years. Since 1990, the internationally active company, headquartered in Dortmund, has concentrated on the development and production of innovative ultrasonic sensors for industrial automation technology.

The microsonic team at the opening ceremony of the new company headquarters

Our ultrasonic expertise gives you a head start

Concentrating on core skills

Today, microsonic is a globally recognised specialist in ultrasonic sensors for applications in industrial automation technology and industrial vehicles. A large number of patent applications and a constantly growing assortment of products are witness to the power of innovation at microsonic.

Examples are ultrasonic double-sheet control systems that work with no calibration at all, label sensors that use special Teach-in methods to be able to detect even critical labels and splices at high transport speeds, and ultrasonic proximity switches with switching frequencies of up to 250 Hz.

Certified quality

The objectives of microsonic's quality management have always been to deliver maximum product quality and to be fully in control of every single step in the process from development to full-scale production, and to provide verifiable

documentation for those processes. The company's quality management system has been certified by the ICG Zertifizierung GmbH and complies with the international standard DIN EN ISO 9001.

Responding to customers and needs without ifs and buts

It is the aim of all employees at microsonic to respond quickly and flexibly to the wishes of our customers. Even when this results in a one-off for a particular company – a special length of cable, an individual software adaptation or a completely new development.

At microsonic, we always try to implement your wishes, requirements and ideas as rapidly as possible. We regard them as the prime movers for further progress in terms of development, production, sales and service.

People are responsible for quality.

The ultrasonic principle: Where high performance sounds good

*Ultrasonic sensors
have set new standards
in automation.*

Ultrasonic sensors emit short, high-frequency sound pulses at regular intervals. These propagate in the air at the velocity of sound. If they strike an object, then they are reflected back as echo signals to the sensor, which itself computes the distance to the target based on the time between emitting the signal and receiving the echo.

As the distance to an object is determined by measuring the time of flight and not by the intensity of the sound, ultrasonic sensors are excellent at suppressing background interference.

Virtually all materials that reflect sound can be detected, regardless of their colour. Even transparent materials or thin foils represent no problem for an ultrasonic sensor.

microsonic ultrasonic sensors are suitable for target distances from 20 mm

to 10 m, and as they measure the time of flight, they can take a measurement with pinpoint accuracy. Some of our sensors can even resolve the signal to an accuracy of less than 0.025 mm. Ultrasonic sensors can see through dust-laden air and ink mists. Even thin deposits on the sensor membrane do not impair its function.

Sensors with a blind zone of only 20 mm and an extremely thin beam spread are making entirely new applications possible today: fill level measurement in wells of micro-titre plates and test tubes, as well as the detection of small bottles in the packaging industry, can be implemented with ease. Even thin wires are reliably detected.

Fluids

Clear water or black coffee – the ultrasonic sensor registers virtually all liquids.

Colour

Ruby red, steel blue, lemon yellow...

What's your favourite colour?

The ultrasonic sensor loves them all.

Missing contrast

White on white, black on black?

No problem for the ultrasonic sensor.

Transparency

Sheets of glass and skin-thin foils – the ultrasonic sensor detects them all reliably.

Textiles

Velvet and leather – almost all fabrics can be detected.

Filling-level control

Coarse grains, chips or fine sand – when it comes to level control, the ultrasonic sensor is unbeatable.

The right solution for every application

The ultrasonic sensor in reflective mode (proximity switch)

represents the classic method of operation. It exploits its background interference suppression which is superior to other sensing principles. Here, the switch is activated as soon as the target is located within the preset detect point. The detect point is coupled with a hysteresis.

This operating mode is suitable for, e.g. counting items on a conveyor belt or for presence detection. The overview table for distance measurement sensors lists all the sensor types that can work in reflective mode.

The window mode

is an extension of the reflective mode. In this case the switch is only activated when the target is located within a window defined by two window limits. This can be used to monitor, for example, correct bottle sizes in a crate – taller and shorter bottles are rejected.

Window mode and also two-way or reflective ultrasonic barriers can be based on all ultrasonic sensors that support microsonic Teach-in.

The two-way or reflective ultrasonic barrier

operates in a similar way as a photoelectric barrier. However, in contrast to the photoelectric barrier, no special triple reflector or similar device is needed. Any reflector, e.g. a metal flag, is adequate. In this case, the ultrasonic sensor is set up in window mode in such a way that the fixed reflector lies within the window. The two-way reflective ultrasonic barrier supplies a signal as soon as an object completely obscures the reflector. It does not matter whether the target absorbs all the sound or even "deflects" it. Therefore, this operating mode is used for foams and other materials, that are difficult to detect, as well as scanning objects with irregular surfaces.

Applications

Robotic sensing

Crate inspection

Quality control

Monitoring filling level in 6 bar overpressure

The ultrasonic sensors with analogue output

transmit the measurement as a proportional voltage (0–10 V) or current (4–20 mA). For ultrasonic sensors with analogue output, the near and far window boundary of the analogue characteristic and also whether the characteristic is rising or falling can be configured. Depending on the sensor type and window width, resolution lies between 0.025 and 2.4 mm.

The ultrasonic sensors with IO-Link

permit continuous communication on all levels of the system architecture, from the sensor to the upper field bus level. The distance value measured is transmitted to the controller in bit serial form.

Also see: IO-Link in detail (next page)

The ultrasonic double-sheet controls

operate as a one-way barrier and detect two or more sheets inadvertently stuck together. The transmitter-receiver arrangement can scan papers, films, cardboard and thin sheet metal. Signal outputs are available for indicating double and missing sheets.

The ultrasonic label and splice sensors

work on the same principle as ultrasonic double-sheet controls. Since the interior adhesion of the labels to the backing material represents a joint without a separating air layer, label sensors must be calibrated to the backing material and the labels.

The ultrasonic edge sensors

are designed as fork sensors and work as one-way barriers. They are used for contact-free web edge control and emit an analogue signal of 0–10 V or 4–20 mA which is proportional to the orientation of the path edge.

IO-Link: the new standard at the field bus level

The IO-Link interface in our ultrasonic sensors gives you everything you need to implement continuous communication on all levels of the system architecture, right down to the sensor. IO-Link can enormously simplify the startup and maintenance of either a machine or plant.

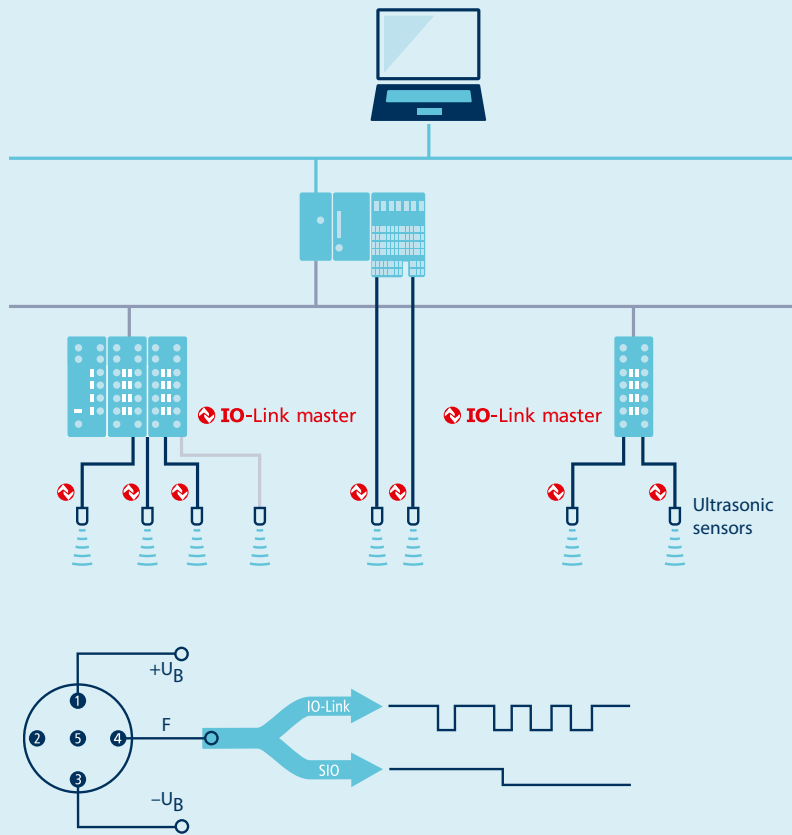

Functional principle

Following every switch-on, the sensor is in SIO mode (Standard-Input-Output mode) and functions just like any normal ultrasonic proximity switch with Push-Pull output stage.

With the wake-up signal, an IO-Link-enabled controller can transfer the ultrasonic sensor into the communication or IO-Link mode. The controller can now exchange both process and service data with the device.

An IO-Link master can have one or a number of inputs and outputs. Only one IO-Link device is attached at each input/output. A standard three wire cable joins up the sensors and actuators. This non-shielded line can be up to 20 metres in length. Mixed operation is possible thanks to complete compatibility with SIO mode: at a master, a number of sensors and actuators can be run in the IO-Link and others in the SIO mode.

Example of the system architecture

Push-Pull output stage permits switching from SIO mode to IO-Link mode.

The advantages of IO-Link

- In IO-Link, the distances measured are cyclically transmitted to the master; thus the IO-Link mode can replace an analogue output at no significant expense.
- Following a sensor failure, the controller can automatically reload all the settings into the new sensor.
- Reduction in planning outlay achieved from a standardised integration of devices into the controller via a manufacturer-independent IODD description file.
- Reduced startup times thanks to a centralised provision of data and parameters in the controller.
- Greater equipment availability levels coming from maximum transparency and system-wide diagnosis all the way down into the device itself.

Continuous communication permits process/service data to be transmitted between sensors/actuators and the controller.

An IO-Link system consists of IO-Link devices – mainly sensors, actuators or combinations of them – a standard three wire sensor/actuator cable and an IO-Link master.

More information on IO-Link can be found at www.io-link.com.

Installation instructions for ultrasonic sensors

Notes for installation and operation

Ultrasonic sensors can be incorporated and operated in any position. However, positions that could lead to severe soiling of the sensor surfaces should be avoided. Drops of water and severe deposits on the surface of the transducer can impair functionality. However, small dust deposits and splashes of paint do not affect functionality.

For scanning objects with flat and smooth surfaces, the sensors should be mounted at an angle of $90^\circ \pm 3^\circ$ to the surface.

On the other hand, rough surfaces can cope with much larger angular deviations. In terms of ultrasonics, a surface is considered rough when its peak-to-valley height is in the order of magnitude of the wavelength of the ultrasonic frequency or is larger than this.

The sound is then reflected in a scattered fashion and this can lead to a shortening of the operating range. In the case of rough surfaces, the maximum permissible angular deviation and the maximum possible detection range should be determined by way of trials.

Sound-absorbent materials, e.g. cotton wool or soft foams, can reduce the operating range. On the other hand, liquids and solid materials are very good reflectors of sound.

Mounting spacing and synchronisation

If two or more sensors are mounted too close to one another, they can influence one another. To avoid this, either the mounting spacing must be sufficiently large, or the sensors must be synchronised with one another. The following table lists the minimum mounting distances between unsynchronised sensors.

Operating range	A	B
0.07 m	≥ 0.25 m	≥ 1.10 m
0.15 m	≥ 0.25 m	≥ 1.30 m
0.24 m	≥ 0.25 m	≥ 1.40 m
0.25 m	≥ 0.35 m	≥ 2.50 m
0.35 m	≥ 0.40 m	≥ 2.50 m
0.7 m	≥ 0.70 m	≥ 4.00 m
1.0 m	≥ 0.70 m	≥ 4.00 m
1.3 m	≥ 1.10 m	≥ 8.00 m
3.4 m	≥ 2.00 m	≥ 18.00 m
6.0 m	≥ 4.00 m	≥ 30.00 m

The mounting distances should be regarded as recommended values. In the case of objects positioned at an angle, the sound can also be "reflected" to an adjacent sensor. Minimum mounting distances should then be determined by way of trials.

If sensors are mounted at distances from one another that are less than the values specified in the table, the ultrasonic sensors must be synchronised with one another. This means that the sensors always carry out their measurements at the same time.

Many microsonic sensors have integrated synchronisation, which can be activated for example simply by connecting to pin 5 on the device connector. Other sensors require an external clock signal.

Redirecting the sound

The sonic beam can be redirected via a reverberant, smooth reflecting surface without significant losses. Accessories are available to deflect the sound through 90°.

These can be used to advantage in certain confined installations.

Accuracy

The (absolute) accuracy is the discrepancy between the real distance between sensor and object and the distance as measured by the sensor. The accuracy obtainable depends on the reflective properties of the object and the physical influences affecting the velocity of sound in air.

Objects with poor reflective properties or a surface roughness greater than the wavelength of the ultrasonic frequency have an adverse effect on the accuracy achievable. It is not possible to quantify this exactly but as a rule of thumb we can assume an inaccuracy of several wavelengths of the ultrasonic frequency employed.

Air temperature

The biggest influence on the velocity of sound, and hence on the accuracy, is the temperature of the air (0.17 %/K). Therefore, the majority of ultrasonic sensors from microsonic contain temperature compensation circuitry. Even better is to carry out a comparative measurement over a known distance to determine the influence of temperature. With temperature-compensated sensors, an accuracy of $\leq \pm 1$ % can be achieved.

Air pressure

The velocity of sound over a wide range does not depend on the pressure of the air. microsonic has special sensors for measuring distances in up to 6 bar overpressure.

Relative humidity

In comparison to the influence of temperature, the effect of the humidity of the air on the accuracy can be ignored.

Repeat accuracy R

The repeat accuracy, or reproducibility, describes the deviation in the measured distances under the same conditions over a defined period.

The repeat accuracy of microsonic sensors is better than ± 0.15 %.

Always meeting the standard

All sensors comply with the requirements of German national (DIN) and European (EN) standards.

The detection zones of ultrasonic sensors

The most important criterion

to bear in mind when selecting an ultrasonic sensor is its detection range and the associated three-dimensional detection zone.

In measuring the sensors, various standard reflectors are introduced into the detection zones from the side, and the points at which these reflectors are detected by the sensor are marked.

The red areas

are determined with a thin, round bar (10 or 27 mm diameter depending on type of sensor) and indicate the typical operating range of a sensor.

In order to obtain the blue areas,

a plate (500 × 500 mm) is introduced into the beam spread from the side. In doing

so, the optimum angle between plate and sensor is always employed. This therefore indicates the maximum detection zone of the sensor. It is not possible to evaluate ultrasonic reflections outside the blue beam spread.

A reflector with reflective properties inferior to those of the round bar can be detected in a zone that is smaller than that indicated by the red area. On the other hand, a reflector with better reflective properties will be detected in a zone with a size somewhere between that of the red and blue areas.

A sensor's blind zone determines its smallest permissible detection range. No objects or disturbing reflectors should be placed in the blind zone because this can lead to incorrect measurements.

Objects may be introduced into the detection zone from any direction.

Method for determining detection zones

These symbols in the technical data show the operating ranges of microsonic ultrasonic sensors.

The operating ranges

given in the diagrams specify the distance at which the ultrasonic sensor can measure common reflectors with sufficient operating reserve. The sensor can also be employed for distances up to its maximum range in the case of good reflectors. The maximum detection range is always greater than the operating range. The diagrams apply for 20°C, a relative humidity of 50% and normal pressure.

The attenuation of sound in the air

depends on the temperature and pressure of the air as well as its relative humidity. The physical relationships are complex and have different effects at different ultrasonic frequencies.

For simplicity, we can say that the attenuation in the air increases with rising temperature and rising humidity. This necessitates a reduction in the size of the detection zones.

With a lower relative humidity and falling temperatures, the attenuation in the air decreases and the detection zones enlarge accordingly.

The reduction in the size of the detection zone is essentially compensated for by the sensor's operating reserves. And at temperatures below 0°C some sensors can operate over distances certainly twice as large as those given here.

As the pressure of the air rises, the attenuation in the air drops considerably. This aspect should be taken into account for applications involving overpressure. Sound propagation is impossible in a vacuum.

mic⁺

mic⁺ sensors are available in four unit variants with five different detection ranges.

HIGHLIGHTS

- › Digital display with direct measured value output in mm/cm or %
- › IO-Link interface › for support of the new industry standard
- › Numeric configuration of the sensor using digital display › permits complete advance configuration of the sensor
- › Automatic synchronisation and multiplex operation › for simultaneous operation of up to ten sensors in close quarters
- › UL Listed to Canadian and US safety standards

BASICS

- › 1 Push-Pull switching output › pnp or npn basis
- › 1 or 2 switching outputs › in pnp or npn variants
- › Analogue output 4–20 mA and 0–10 V › with automatic switching between current and voltage outputs
- › Analogue output plus 1 pnp switching output
- › 5 detection ranges with a measurement range of 30 mm to 8 m
- › microsonic Teach-in by using button T1 or T2
- › 0.025 mm to 2.4 mm resolution
- › Temperature compensation
- › 9–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

TouchControl with LED display

The mic⁺ sensor family

embedded in its M30 housing design covers a measuring range from 30 mm to 8 m with its five detection ranges. Depending on the detection range, the internal resolution for distance measurement is 0.025 mm to 2.4 mm. All sensors are equipped with integrated temperature compensation.

The sensors are listed to applicable UL Standards and requirements by UL for Canada and the US.

Four different output stages

are available for all five detection ranges:

-  1 switching output, optionally in pnp, npn or Push-Pull circuitry
-  2 switching outputs, optionally in pnp or npn circuitry
-  1 analogue output 4–20 mA and 0–10 V
-  1 analogue output with an additional pnp switching output

With TouchControl

all sensor settings are made. The easily readable LED display constantly shows the current distance value and automatically alternates between the millimetre and centimetre indication. By operating the two keys beneath the LED display, the parameterisation is called up and the self-explanatory menu structure is run through. The detection points of the switching outputs and the window limits for the analogue output can be preset

numerically via the LED display without the object to be detected being positioned within the detection range. Therefore, it is possible to completely set the sensor without the help of auxiliary reflectors, even outside the actual application.

Two three-colour LEDs

always indicate the current status of the switching outputs and/or the analogue output.

Further additional functions (add-ons)

are available as an option within the TouchControl menu structure.

Measured distances can be smoothed with different measurement filters and dampened using a ten-level filter. A high measuring-value attenuation is useful for filling-level measuring operations with wave motions or in situations where parts may sporadically fly between the sensor and the actual measuring surface. The default filter is F01. Thus, the sensors are preset for rapid counting and control operations.

Winding diameter measuring at the laminating machine

As further add-ons, the default settings of the switching hysteresis of the switching outputs can be changed if required. The LED display can be permanently switched off or dimmed.

Analogue sensors

verify the load connected to the output and automatically switch to 4–20 mA current output and 0–10 V voltage output depending on the resistance value. The load verification by the sensor is always initiated upon connection of the operating voltage.

In the add-on menu of TouchControl, the user can, however, also preset the sensor to current or voltage output. In this menu, the measuring value output on the LED display with analogue sensors can additionally be changed to indicate percentage. The window limits of the

analogue characteristic curve then correspond to the 0% or the 100% value respectively.

Synchronisation

of up to ten sensors automatically also operates in a mixed configuration of sensors with different detection ranges. The measurement repetition rate is then determined by the sensor with the largest detection range. If the sensors are electrically connected via pin 5 of the M12 circular connector, the synchronisation is active.

In synchronised operation, all sensors initiate the measuring process at exactly the same time. With relatively narrow mounting distances between the sensors, a sensor may also receive echo signals from an adjacent sensor. This can be used as an advantage,

e.g. to broaden a sensor's detection range.

Synchronisation via pin 5

If more than ten sensors need to be synchronised, this can be carried out with the SyncBox1, which is available as an accessory.

Multiplex operation

ensures that each sensor can only receive echo signals from its own transmission pulse, which completely avoids any interference between the sensors (crosstalk).

Numerical setting via LED display

Press both keys until "Pro" for programming is shown on the LED display.

Select the output to be set (according to sensor type d1, d2 or IU).

Via the LED display, set the switching point (or, with analogue outputs, the sensor-close window limit) in mm/cm.

If window mode is required for the switching output, the rear window limit must be set (or, with analogue outputs, the sensor-distant window limit) in mm/cm.

Select between NCC and NOC (or, with analogue outputs, between rising and falling characteristic).

Ready.

For numerical input, the object to be detected does not need to be placed within the sensor's detection range.

Each sensor is assigned an address from 1 to 10 for this purpose in the add-on menu. The sensors then work in multiplex mode and carry out their measurements one after the other in ascending address order.

The setting of a switching or an analogue output

is either carried out by means of numerically entering the desired distance values (refer to graphic left below) or by means of a Teach-in procedure (refer to this page). Thanks to this, the user can select the preferred setting mode.

In the microsonic Teach-in process

the object to be detected must be placed in the desired distance **1** to the sensor. The button assigned to the output must then be pressed until **TEACH d1** (or **TEACH d2**) appears on the LED display. Finally, the Teach-in procedure must be confirmed by a further short keystroke. Ready.

Teach-in of a switching point

To set an analogue output

the object to be detected must first be placed on the sensor-close window limit **1** and the key assigned to the output must be pressed until **TEACH IU** appears on the display. Then, the object to be detected must be moved to the sensor-distant window limit **2** and the Teach-in procedure must be terminated by a further short keystroke. Ready.

To set of window mode

with two switching points, is the same as setting a switching point.

Teach-in of an analogue characteristic or a window with two switching points

NCC/NOC

for the switching outputs and rising/falling characteristic for the analogue sensors can also be set by means of the Teach-in procedure. For this, press the key assigned to output until the symbol \overline{L} or $\underline{\overline{-}}$ appears on the display.

With each further keystroke, the NCC/NOC ($\underline{\overline{-}}$ / \overline{L}) and rising/falling ($\underline{\overline{-}}$ / $\overline{-}$) settings are alternated. After approx. 10 seconds, the new setting is automatically stored.

LinkControl

consists of the LinkControl adapter and the LinkControl software and facilitates the configuration of the mic+ sensors via a PC or laptop with all conventional Windows® operating systems. All settings of the TouchControl menu can be read out during operation, edited on the PC, buffered and re-entered into the sensor. Especially the two measuring value plotters for the visualisation of distance values support the development of solutions for complex automation tasks (also refer to the chapter "Accessories").

Sensor connected to the PC via LCA-2 for programming

1 pnp switching output + analogue output

mic

These completely metal mic sensors are available in two device designs with five different detection ranges.

HIGHLIGHTS

- › M30 housing and M12 circular connector in metal design › for harsh usage conditions
- › Automatic synchronisation › for simultaneous operation of up to ten sensors in close quarters

BASICS

- › 1 switching output in pnp variant
- › Analogue output 4–20 mA and 0–10 V › with automatic switching between current and voltage outputs
- › 5 detection ranges with a measurement range of 30 mm to 8 m
- › microsonic Teach-in on pin 5
- › 0.18 mm to 2.4 mm resolution
- › Temperature compensation
- › 9–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

M12 metal circular connector

Operation under rough conditions

This very solid construction

is fully made of metal from the M30 housing to the M12 circular connector. Since the sensors do not contain any operating elements or signal lamps, they are especially suited for application under extreme ambient conditions with high mechanical loads for housing and plug connector. The sensors are available in five detection ranges and cover a measuring range of 30 mm up to 8 m.

Two output stages

are available for all five detection ranges:

-  1 pnp switching output
-  1 analogue output 4–20 mA and 0–10 V

Sensors with switching output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

- › Place object to be detected at the desired distance **1**.
- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then apply $+U_B$ to pin 5 again for about 1 second.

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed reflector

- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then apply $+U_B$ to pin 5 again for about 10 seconds.

Teach-in of a two-way reflective barrier

For configuration of a window

- › Place object at the near edge of the window **1**.
- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then move the object to the far edge of the window **2**.
- › Then apply $+U_B$ to pin 5 again for about 1 second.

Teach-in of an analogue characteristic or a window with two switching points

NCC/NOC

and rising/falling analogue characteristic curve can also be set via pin 5.

LinkControl

optionally permits the extensive parameterisation of mic sensors. The LCA-2 LinkControl adapter, which is available as an accessory, can be used to connect mic sensors to the PC.

Sensor connected to the PC via LCA-2 for programming

Synchronisation

permits the simultaneous use of multiple mic sensors in one application. To avoid mutual interference, the sensors can be synchronised with one another. To do this, all the sensors are electrically connected on pin 5.

Synchronisation using pin 5

If more than ten sensors need to be synchronised, this can be carried out with the SyncBox1, which is available as an accessory.

pico⁺

"The little guy" that can do it all: 4 ranges, 3 output signals, 2 housing variants and an IO-Link interface.

HIGHLIGHTS

- › Variant with 90° angled head
- › IO-Link interface › for support of the new industry standard
- › Automatic synchronisation and multiplex operation › for simultaneous operation of up to ten sensors in close quarters
- › UL Listed to Canadian and US safety standards
- › Improved temperature compensation › adjustment to working conditions within 120 seconds

BASICS

- › 1 Push-Pull switching output, pnp or npn basis
- › Analogue output 4–20 mA or 0–10 V
- › 4 detection ranges with a measurement range of 20 mm to 1.3 m
- › microsonic Teach-in on pin 5
- › 0.069 mm to 0.1 mm resolution
- › 10–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

The pico+ ultrasonic sensors

are a cylindrical series with M18 threaded sleeves and a housing length of only 41 mm. In addition to the variants with an axial beam direction, there is also a housing variant with a 90° angled head and radial beam direction.

With four detection ranges from 20 mm to 1.3 m and three different output stages, this sensor family covers a wide range of applications.

Sensors with the Push-Pull output stage support SIO and IO-Link modes. Sensors with analogue output are optionally available with 4–20 mA current output or 0–10 V voltage output.

In SIO mode, sensors are configured using the microsonic Teach-in procedure on pin 5.

The sensors are listed to applicable UL Standards and requirements by UL for Canada and the US.

For the pico+ sensor family

there are two output stages and four detection ranges available:

-  1 Push-Pull switching output with pnp and npn switching technology
-  1 analogue output 4–20 mA or 0–10 V

Sensors with switching output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

- › Place object to be detected at the desired distance **1**.

- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then apply $+U_B$ to pin 5 again for about 1 second.

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed reflector

- › Apply $+U_B$ to pin 5 for about 3 seconds until both LEDs flash.
- › Then apply $+U_B$ to pin 5 again for about 10 seconds.

Teach-in of a two-way reflective barrier

For setting the analogue output

- › Initially place the object to be detected at the sensor-close window limit **1**.
- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then move the object to the sensor-distant window limit **2**.
- › Then apply $+U_B$ to pin 5 again for about 1 second.

Teach-in of an analogue characteristic or a window with two switching points

NCC/NOC

and rising/falling analogue characteristic curve can also be set via pin 5.

One green and one yellow LED

indicate the state of the output and support microsonic Teach-in.

LinkControl

optionally permits the extensive parameterisation of sensors. The LCA-2 LinkControl adapter is available as an accessory and can be used to connect pico+ sensors to the PC.

Sensor connected to the PC via LCA-2 for programming

Easy to synchronise

A number of pico+ sensors can be run closely packed in applications synchronised to stop them from influencing one another. To this end, the sync mode has to be activated and all the sensors are to be electrically connected on to another with pin 5.

Synchronisation via pin 5

IO-Link integrated

in version 1.1 for sensors with switching output.

ipc⁺

ipc⁺ well equipped: 2 Push-Pull switching outputs or 1 Push-Pull switching output with an analogue output in M18 housing.

HIGHLIGHTS

- › Analogue output 4–20 mA or 0–10 V plus 1 Push-Pull switching output in M18 design
- › IO-Link interface › for support of the new industry standard
- › Smart Sensor Profile
- › Improved temperature compensation › adjustments to working conditions within 120 seconds

BASICS

- › 2 Push-Pull switching outputs, pnp or npn basis
- › 4 detection ranges with a measurement range of 20 mm to 1.3 m
- › microsonic Teach-in on pin 5
- › 0.1 mm resolution
- › 10–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

 **IO-Link**
integrated

Also see the chapter
"Function and
advantages"

The lpc+ ultrasonic sensors

are optionally equipped with two Push-Pull switching outputs or an analogue output plus a Push-Pull switching output. The compact series with M18 threaded sleeves covers four detection ranges from 20 mm to 1.3 m.

Ultrasonic sensors with the Push-Pull output stage support SIO and IO-Link modes. Sensors with analogue output are optionally available with 4–20 mA current output or 0–10 V voltage output. In SIO mode, sensors are configured using the microsonic Teach-in procedure on pin 5.

For the lpc+ sensor family

there are 2 output stages and 4 detection ranges available:

-  2 Push-Pull switching outputs with pnp or npn switching technology
-  1 Push-Pull switching output and analogue output 4–20 mA or 0–10 V

Ultrasonic sensors with switching output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

- › Place object to be detected at the desired distance **1**
- › Apply $+U_B$ to pin 5 for about 3 seconds
- › Then apply $+U_B$ to pin 5 again for about 1 second

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed reflector

- › Apply $+U_B$ to pin 2 for about 3 seconds
- › Then apply $+U_B$ to pin 2 again for about 10 seconds

Teach-in of a two-way reflective barrier

For configuration of a window

- › Place object at the near edge of the window **1**
- › Apply $+U_B$ to pin 5 for about 3 seconds
- › Then move the object to the far edge of the window **2**
- › Then apply $+U_B$ to pin 5 again for about 1 second

Teach-in of an analogue characteristic or a window with two switching points

NCC/NOC

and rising/falling analogue characteristic curve can also be set via pin 5.

Two green and two yellow LEDs

indicate the state of the output and support microsonic Teach-in.

LinkControl

optionally permits the extensive parameterisation of lpc+ sensors. The LCA-2 LinkControl adapter, which is available as an accessory, can be used to connect lpc+ sensors to the PC.

Sensor connected to the PC via LCA-2 for programming

Easy to synchronise

A number of lpc+ ultrasonic sensors can be run closely packed in applications synchronised to stop them from influencing one another. To this end, the sync mode has to be activated and all the sensors are to be electrically connected one to another with pin 5.

Synchronisation via pin 5

IO-Link integrated

in version 1.1. The lpc+ ultrasonic sensors are equipped with Smart Sensor Profile, which creates more transparency between IO-Link devices.

nero

Ultrasonic proximity switch nero in M18 plastic sleeve with 4 detection ranges.

HIGHLIGHTS

- › Variant with 90° angled head

BASICS

- › 1 switching output, pnp or npn basis
- › 4 detection ranges with a measurement range of 20 mm to 1.3 m
- › microsonic Teach-in on pin 2
- › 0.2 mm resolution
- › 10–30 V operating voltage

nero ultrasonic proximity switches

are available in a M18 plastic sleeve. In addition to the axial beam direction variant, there is also a housing variant with a 90° angled head and radial beam direction. The ultrasonic proximity switches detect objects contactless and reliable a vailable in four detection ranges from 20 mm to 1.3 m.

For the nero sensor family

there are 1 output stage and 4 detection ranges available:

- 1 switching output with pnp or npn switching technology

Sensors with switching output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

- › Place object to be detected at the desired distance **1**
- › Apply +U_B to pin 2 for about 3 seconds
- › Then apply +U_B to pin 2 again for about 1 second

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed reflector

- › Apply +U_B to pin 2 for about 3 seconds
- › Then apply +U_B to pin 2 again for about 10 seconds

Teach-in of a two-way reflective barrier

For configuration of a window

- › Place object at the near edge of the window **1**
- › Apply +U_B to pin 2 for about 3 seconds
- › Then move the object to the far edge of the window **2**
- › Then apply +U_B to pin 2 again for about 1 second

Teach-in of a window with two switching points

NCC/NOC

can also be set via pin 2.

One green and one yellow LED

indicate the state of the output and support microsonic Teach-in.

nano

With a total length of only 55 mm, it is the shortest M12 ultrasonic sensor on the market.

HIGHLIGHTS

- › Ultrasonic sensor in the M12 threaded sleeve
- › The total length including plug is only 55 mm
- › Improved temperature compensation › adjustment to working conditions within 45 seconds

BASICS

- › 1 switching output in pnp or npn variant
- › Analogue output 4–20 mA or 0–10 V
- › 2 detection ranges with a measurement range of 20 mm to 350 mm
- › microsonic Teach-in on pin 2
- › 0.069 mm resolution
- › Operating voltage 10–30 V › for use with various voltage networks

With a housing length of only 55 mm

nano sensors with switching outputs are the smallest ultrasonic sensors inside the M12 threaded sleeve on the market. Analogue sensors are 60 mm long. nano sensors have a 4-pole M12 circular plug and are taught via pin 2.

For the nano-sensor family

there are four output stages and two detection ranges available:

-  1 switching output in either pnp or npn switching technology
-  1 analogue output 4–20 mA or 0–10 V

Sensors with switching output have three operating modes:

- Single switching point
- Two-way reflective barrier
- Window mode

The temperature compensation

of the nano sensors profits from a significant improvement. The sensors reach their operating point only 45 seconds after activation of the operating voltage. We now compensate for the influence of self-heating and installation conditions. This brings improved precision shortly after activation of the supply voltage and in running operation.

Teach-in of a single switching point

- Place object to be detected at the desired distance **1**.
- Apply $+U_B$ to pin 2 for about 3 seconds.
- Then apply $+U_B$ to pin 2 again for about 1 second.

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed mounted reflector

- Apply $+U_B$ to pin 2 for about 3 seconds.
- Then apply $+U_B$ to pin 2 again for about 10 seconds.

Teach-in of a two-way reflective barrier

To set a window with two switching points

- Place object to the sensor-close window limit **1**.
- Apply $+U_B$ to pin 2 for about 3 seconds until both LEDs flash.

- Then move the object to the sensor-distant window limit **2**.
- Then apply $+U_B$ to pin 2 again for about 1 second until LED 2 extinguishes.

For setting the analogue output

- Initially position the object to be detected to the sensor-close window limit **1**.
- Apply $+U_B$ to pin 2 for about 3 seconds until both LEDs flash.
- Then move the object to the sensor-distant window limit **2**.
- Then apply $+U_B$ to pin 2 again for about 1 second.

Teach-in of an analogue characteristics or a window with two switching points

NCC/NOC

and rising/falling analogue characteristics can also be set via pin 2.

One green and one yellow LED

indicate the state of the output and support microsonic Teach-in.

Ics⁺

The Ics⁺ ultrasonic sensors in a compact square housing – with analogue/switching outputs and IO-Link.

HIGHLIGHTS

- › Very compact housing with a base area of only 62.2 mm x 62.2 mm
- › IO-Link interface › for support of the new industry standard
- › Synchronisation and multiplex mode › for simultaneous operation of up to ten sensors in close quarters
- › 8 m maximum detection range
- › UL Listed to Canadian and US safety standards

BASICS

- › 1 Push-Pull switching output, or 2 pnp switching outputs
- › Analogue output 4–20 mA and 0–10 V › with automatic switching between current and voltage outputs
- › microsonic Teach-in by using button T1 and T2
- › 0.18 mm to 2.4 mm resolution
- › Temperature compensation
- › 9–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

The Ics+ ultrasonic sensors

have block-like plastic housing (PBT) with a base area of only 62.2 x 62.2 mm and four fastening bores.

The sensors are Listed to applicable UL Standards and requirements by UL for Canada and the US.

Two dual colour LEDs

show all operating statuses.

Three output stages for selection:

-  1 Push-Pull switching output with an IO-Link
-  2 pnp switching outputs
-  1 analogue output 4–20 mA and 0–10 V

Using the two buttons T1 and T2

the Ics+ sensors can be easily set.

The Ics+ sensors with switching outputs have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

- › Place object **1** to be detected at the desired distance.
- › Push button T1 for approx. 3 seconds.
- › Then push button T1 again for approx. 1 second.

Teach-in of switching point

Teach-in of a two-way reflective barrier

with a fixed mounted reflector

- › Push button T1 for approx. 3 seconds.
- › Then push button T1 again for approx. 10 seconds.

Teach-in of a two-way reflective barrier

For setting the analogue output

- › initially position the object to be acquired to the sensor-close window limit **1**.
- › Push button T1 for 3 seconds.
- › Then move the object to the sensor-distant window limit **2**.
- › Then push button T1 again for approx. 1 second.

Teach-in of an analogue characteristics or a window with two switching points

For configuration of a window

with two switching points on a single switched output, the procedure is the same as setting the analogue.

Analogue sensors

check the connected working resistance at the output and automatically switch to 4–20 mA current output or 0–10 V voltage output.

NCC/NOC

and rising/falling analogue characteristics can also be set via the buttons.

LinkControl

permits comprehensive parameterisation of the Ics+ ultrasonic sensors via the LinkControl adapter LCA-2 which connects the sensors to the PC.

Sensor connected to the PC via LCA-2 for programming

Easy to synchronise

If several Ics+ ultrasonic sensors are operated in one application, they can be synchronised via pin 5 to prevent interference.

Synchronisation via pin 5

If more than ten sensors need to be synchronised, this can be carried out with the SyncBox1 (see the chapter “Accessories”). Synchronisation via pin 5 is also possible in IO-Link mode.

IO-Link

Ultrasonic sensors Ics+340/F and Ics+600/F have a Push-Pull switching output and support IO-Link in version 1.0 (see “Function and advantages: IO-Link in detail”).

analogue output

analogue output

¹⁾ Can be programmed with LinkControl.

Ics

Ultrasonic sensors in the Ics series in cuboidal housing with lateral sound exit are available in three device variants with three different detection ranges.

HIGHLIGHTS

- › Up to 3 pnp switching outputs
- › Automatic synchronisation › for simultaneous operation of up to ten sensors in close quarters

BASICS

- › 2 or 3 switching outputs in pnp variant
- › Analogue output 4–20 mA and 0–10 V › with automatic switching between current and voltage outputs
- › 3 detection ranges with a measurement range of 30 mm to 2 m
- › microsonic Teach-in on pin 5
- › 0.18 mm resolution
- › Temperature compensation
- › 9–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

The Ics sensors

are embedded in block-like plastic housing with four fixation bores, two of which are already equipped with M4 threaded bushings for eased mounting.

Two or three LEDs

indicate all operating states.

Three detection ranges and two output stages are available for selection:

2 pnp switching outputs

3 pnp switching outputs

1 analogue output 4–20 mA and 0–10 V

Via pin 5 at the M12 circular connector,

(Com input), the Ics sensors are set (Teach-in).

Switched output D1 is set by connecting pin 5 to $+U_B$ while switched output D2 is set by connecting pin 5 to $-U_B$. Also the sensors with analogue output are set via pin 5.

The Ics sensors with switched output offer three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

- › Place object to be detected at the desired distance **1**.
- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then apply $+U_B$ to pin 5 again for about 1 second.

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed reflector

- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then apply $+U_B$ to pin 5 again for about 10 seconds.

Teach-in of a two-way reflective barrier

For configuration of a window

- › Place object at the near edge of the window **1**.
- › Apply $+U_B$ to pin 5 for about 3 seconds.
- › Then move the object to the far edge of the window **2**.
- › Then apply $+U_B$ to pin 5 again for about 1 second.

Teach-in of an analogue characteristic or a window with two switching points

NCC/NOG

and rising/falling analogue characteristic curve can also be set via pin 5.

The analogue sensor

checks the load connected to the output and then automatically switch to 4–20 mA output or 0–10 V output to ensure maximum ease of handling.

The Ics-25/DDD is equipped with three pnp switched outputs

which are set with the help of the LinkControl adapter LCA-2 (see the chapter “Accessories”).

In addition to this “offline” programming, all Ics sensors can also be parameterised on the PC with the LCA-2 and the LinkControl software.

Sensor connected to the PC via LCA-2 for programming

Synchronisation

permits the simultaneous use of multiple Ics sensors in one application. To avoid mutual interference, the sensors can be synchronised with one another. To do this, all the sensors are electrically connected on pin 5.

Synchronisation via pin 5

ZWS

The zws sensors are among the smallest ultrasonic sensors available on the market in miniature housings with a Teach-in button.

HIGHLIGHTS

- › Small ultrasonic sensor in cuboidal housing
- › Installation-compatible with many optical sensors › a true alternative for critical applications
- › Up to 250 Hz switching frequency › for fast sampling
- › Optionally with SoundPipe wave guide attachment
- › Synchronisation input
- › Improved temperature compensation › adjustment to working conditions within 45 seconds

BASICS

- › 1 switching output in pnp or npn variant
- › Analogue output 4–20 mA or 0–10 V
- › 5 detection ranges with a measurement range of 20 mm to 1 m
- › microsonic Teach-in using a button
- › 20–30 V operating voltage

The miniature sensor housing

of the zws-15 has dimensions of 20 mm x 32 mm x 12 mm. The housing's design and mounting is compatible with many optical sensors. This facilitates the conversion to ultrasonic sensors for critical applications.

For the zws sensor range

two output versions and five detection ranges are available:

-  1 switching output, optionally in pnp or npn circuitry
-  1 analogue output 4–20 mA or 0–10 V

The Teach-in button

on the top facilitates the convenient setting of the sensor.

Two LEDs

in the sensor housing's upper half indicate the switched output and, respectively the analogue output states.

The zws sensors with switched output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

by positioning the object to be detected within the desired distance **1** to the sensor, pressing the button for approx. 3 seconds and then pressing it once more for approx. 1 second. Ready.

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed reflector can be set up with the help of a permanently mounted reflector by mounting the zws sensor and the reflector, then pressing the button for approx. 3 seconds and then pressing it once more for approx. 10 seconds. Now, the two-way reflective barrier has been set.

Teach-in of a two-way reflective barrier

Set the analogue output

by initially positioning the object to be detected on the sensor-close window limit **1**, pressing the button for approx. 3 seconds, shifting the object

Teach-in of an analogue characteristic or a window with two switching points

to the sensor-distant window limit **2** and pressing the button once more for approx. 1 second. Ready.

To set a window

with two detection points on a single switched output, the procedure is the same as setting the analogue.

NCC/NOC

and rising/falling analogue characteristic curve can also be set using the push-button.

The control input on pin 2

can be used to synchronise multiple zws sensors with each other. The SyncBox2, which is available as an accessory, generates a synchronisation signal output on pin 2. This permits up to 50 zws sensors to be autonomously synchronised (see the chapter "Accessories").

Synchronisation of up to 50 zws sensors

The temperature compensation of the analogue sensors

profits from a significant improvement. The sensors reach their operating point only 45 seconds after activation of the operating voltage.

zws-7: 250 Hz switching frequency for fast measurement

At a maximum detection range of 100 mm, the zws-7 can achieve a switching frequency of 250 Hz.

This allows both detection of objects with a high counting frequency and extremely narrow gaps between two objects at fast machinery speeds. The zws-7 responds in under 3 ms.

Additionally fitting the new SoundPipe to the zws-7 markedly raises the power to detect narrow gaps between two objects at high machine speeds.

The zws-7, with a 250 Hz switching frequency, is particularly suitable for counting tasks at high machine speeds.

Technical data:

Operating range:	70 mm
Maximum range:	100 mm
Switching frequency:	250 Hz
Response time:	< 3 ms

Fast zws-7

zws-7/15 with SoundPipe

Brings an intensively bundled sound field directly to the measuring point

The SoundPipe can be used with any zws-7 or zws-15 sensor. It directs sound to the measuring point thus allowing measurements to be taken in drill holes and openings with diameters under 5 mm.

Measurement can be carried out directly before the sound exit opening, since the blind zone is inside the SoundPipe.

The SoundPipe is clipped onto the front of the zws-7 or zws-15 sensors (see the chapter "Accessories").

A typical field of application is measuring levels in micro-plate wells which are used in medical analysis technology. The SoundPipe can be directly placed over the opening; this makes exact positioning that much easier. The attachment can also be used in scanning gaps of only a few millimetres in width between two objects.

The zws sensors are ideal for probing of circuit boards and wafers in the electronic industry or for use in packaging machines in which high-transparency films must be detected.

With the SoundPipe, the zws-7/-15 sensor can measure fill levels in the smallest of openings.

The SoundPipe is positioned directly over the measuring point.

sks

Our "smallest sensor": the sks sensor in miniature housing.

HIGHLIGHTS

- › Very small housing dimensions with two M3 threaded sleeves
- › Installation-compatible with many optical sensors › a true alternative for critical applications
- › IO-Link interface › for support of the new industry standard
- › Optionally with SoundPipe sks1 waveguide attachment
- › Improved temperature compensation › adjustment to working conditions within 45 seconds

BASICS

- › 1 Push-Pull switching output › pnp or npn basis
- › Analogue output 4–20 mA or 0–10 V
- › microsonic Teach-in using a button
- › 0.1 mm resolution
- › 20–30 V operating voltage

The sks sensors

are the smallest ultrasonic sensors from microsonic and feature a housing design reduced by 33% compared to the zws sensors.

The miniature housing of the sks ultrasonic sensor fits in constricted installation locations e.g. for sampling conductor boards and wafer in the electronics industry, for presence checks on conveyor bands or fill-level measurement in small containers. When capacitive or optical sensors come up against their physical limits, installation compatibility of ultrasonic sensors with many optical sensors enable their deployment: simply secured with two M3 screw sockets.

For the sks sensor range

two output versions are available:

-  1 switching output, optionally in pnp-, npn- or Push-Pull circuitry
-  1 analogue output 4–20 mA or 0–10 V

The temperature compensation

of the analogue sensors profits from a significant improvement. The sensors reach their operating point only 45 seconds after activation of the operating voltage. We now compensate for the influence of self-heating and installation conditions. This brings improved precision shortly after activation of the supply voltage and in running operation.

The Teach-in button

on the top of the sensor allows for the convenient configuration of the desired switching distance and operating mode.

Two LEDs

show the operating state of the sensor.

The sks sensor with switching output has three operating modes:

- › Single switching point,
- › Two-way reflective barrier and
- › Window mode

permit configuration using the usual microsonic Teach-in procedure.

The switched output is set by

positioning the object to be detected within the desired distance **1** to the sensor, pressing the button for approx. 3 seconds and then pressing it once more for approx. 1 second. Ready.

Teach-in of a switching point

A two-way reflective barrier

can be set up with the help of a permanently mounted reflector by mounting the sks sensor and the reflector. Then press the button for approx. 3 seconds and then pressing it once more for approx. 10 seconds. Now, the two-way reflective barrier has been set.

Teach-in of a two-way reflective barrier

Set the analogue output

by initially positioning the object to be detected on the sensor-close window limit **1**, pressing the button for approx. 3 seconds, shifting the object to the sensor-distant window limit and pressing the button once more for approx. 1 second. Ready.

Teach-in of an analogue characteristic or a window with two switching points

To set a window

with two detection points on a single switched output, the procedure is the same as setting the analogue.

NCC/NOC

and rising/ falling analogue characteristic curve can also be set using the button.

SoundPipe sks1

intensively bundles the sound field and allows measurements in openings with small diameters. The SoundPipe sks1 (see in the chapter "Accessoires") is pushed on the transducer of the sks.

IO-Link integrated

in version 1.1 for sensors with Push-Pull output.

UCS

The ucs sensors in sturdy metal housing are mechanically compatible with the industrial standard of optical sensors.

HIGHLIGHTS

- › Robust metal housing › for harsh usage conditions
- › Dovetail design › for fast installation
- › Mechanically compatible with the industry standard › a true alternative to the optical sensor
- › Automatic synchronisation › for simultaneous operation of up to ten sensors in close quarters

BASICS

- › 2 anti-valent switching outputs in pnp or npn variant
- › microsonic Teach-in using a button
- › 0.1 mm resolution
- › Temperature compensation
- › 10–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

The sturdy metal housing

of the ucs sensors is mechanically compatible with the industrial standard of optical sensors.

The rotatable circular connector

allows for flexible selection of the mounting location and facilitates flexible wiring.

The ucs sensors

are available with 2 anti-valent pnp or npn switching outputs.

With the anti-valent switching behaviour of the two switching outputs, the first output works as an NO contact and the second works complementarily as an NC contact.

The Teach-in button

on the sensor's top allows for a convenient setting of the desired detection distance and operating mode.

A dual LED

indicates the switching status of the two anti-valent switching outputs.

The ucs sensors have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

The switched output is set by

positioning the object to be detected within the desired distance **1** to the sensor, pressing the button for approx. 3 seconds and then pressing it once more for approx. 1 second. Ready.

Teach-in of a switching point

A two-way reflective barrier

can be set with the help of a permanently mounted reflector by mounting the ucs sensor and the reflector, then pressing the button for approx. 3 seconds and then pressing it once more for approx. 10 seconds. Now, the two-way reflective barrier has been set.

Teach-in of a two-way reflective barrier

Set a window

by initially positioning the object to be detected on the sensor-close window limit **1**, pressing the button for approx. 3 seconds, shifting the object to the sensor-distant window limit **2** and pressing the button once more for approx. 1 second. Ready.

Teach-in of a window with two switching points

Up to ten sensors

can be synchronised with one another. To do this, all the sensors are electrically connected on pin 5 on the M12 circular connector.

Synchronisation using pin 5

If more than ten sensors need to be synchronised, this can be carried out with the SyncBox1, which is available as an accessory.

LinkControl

optionally permits the extensive parameterisation of ucs sensors. The LCA-2 LinkControl adapter, which is available as an accessory, can be used to connect ucs sensors to the PC.

Sensor connected to the PC via LCA-2 for programming

pms

The design of the wash-down stainless steel housing with no crevices and dirt edges makes pms sensor perfectly suited for intensive cleaning and disinfection.

HIGHLIGHTS

- › Innovative housing in Hygienic Design › easy to clean, designed conform to EHEDG guidelines
- › Two stainless-steel housings › for use in the food and pharmaceutical industry
- › PTFE membrane › for protection against aggressive media
- › Sealed against the housing with an O-ring made from FKM › for the highest possible chemical resistance
- › ECOLAB certified and FDA-compliant materials
- › IO-Link interface › for support of the new industry standard

BASICS

- › 1 Push-Pull switching output › pnp or npn basis
- › Analogue output 4–20 mA or 0–10 V
- › 4 detection ranges with a measurement range of 20 mm to 1.3 m
- › Temperature compensation
- › 9–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

The pms ultrasonic sensors

are designed for the most demanding hygienic requirements according to EHEDG guidelines. Two versions of the sensor are available: D12 adapter shaft and D12 bayonet catch. The standard version D12 adapter shaft is mounted with a hygienic screw connection BF-pms/A1 or an adequate mounting clip.

The innovative design of the stainless steel housing ensures that the pms sensor has no horizontal surfaces in almost all conceivable installation positions. Even with horizontal installation of the hygienic sensor for measuring vertical downwards, the rear side of the housing maintains an angle of $\geq 3^\circ$. Cleaning fluids can safely drain off the housing.

Rear side of the housing with an incline of $\geq 3^\circ$

The smooth stainless steel housing has a roughness depth of $R_a < 0.8 \mu\text{m}$ and has no crevices and dirt edges. Besides the sensor design, the right material is crucial. The ultrasonic transducer is protected by a PTFE foil and withstands chemically aggressive cleaning agents and disinfectants. The pms has a high endurance and is ECOLAB certified.

Stainless-steel sensor in wash-down design, all horizontal surfaces are at least inclined by 3°

For the pms hygiene sensors

there are 2 output stages and 4 detection ranges available:

-  1 Push-Pull switching output with pnp or npn switching technology
-  1 analogue output 4–20 mA or 0–10 V

Sensors with switching output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Teach-in of a single switching point

- › Place object to be detected at the desired distance **1**
- › Apply $+U_B$ to pin 2 for about 3 seconds
- › Then apply $+U_B$ to pin 2 again for about 1 second

Teach-in of a switching point

Teach-in of a two-way reflective barrier

with a fixed reflector

- › Apply $+U_B$ to pin 2 for about 3 seconds
- › Then apply $+U_B$ to pin 2 again for about 10 seconds

Teach-in of a two-way reflective barrier

For setting an analogue output

- › initially position the object to be detected on the sensor-close window limit **1**
- › Apply $+U_B$ to pin 2 for about 3 seconds
- › Move the object to the sensor-distant window limit **2**
- › Then apply $+U_B$ to pin 2 again for about 1 second

Teach-in of an analogue characteristic or a window with two switching points

To set a window

with two switching points on a single switch output, the procedure is the same as setting the analogue.

NCC/NOG

and rising/falling analogue characteristic curve can also be set via pin 2.

LinkControl

consist of LinkControl adapter LCA-2 and LinkControl software and permits the configuration of pms sensors via PC or laptop with all conventional Windows® operating systems. For configuration of pms sensors, the additional adapter 5G/M12-4G/M12/M8 is needed.

Sensor connected to the PC via LCA-2 for programming

With the hygienic screw connection

BF-pms/A1 (accessory), the pms sensor is mounted hygienically. The screw connection has a ECOLAB and EHEDG certificate.

pms sensor D12 adapter shaft with hygienic screw connection BF-pms/A1

IO-Link integrated

in version 1.1 for sensors with switching output. The pms ultrasonic sensors are equipped with Smart Sensor Profile, which creates more transparency between IO-Link devices.

The compact pms ultrasonic sensor

is made of stainless steel and FDA-conform materials.

Ensures high resistance

to cleaning agents in areas coming into contact with products in the pharmaceuticals, food and beverage industry.

The innovative hygiene design

was designed in accordance with EHEDG guidelines. Certification has been applied for.

Beverage industry

The pms ultrasonic sensor detects glass and PET bottles in operating mode and withstands the cleaning intervals of filling machines. The sensor is mounted with the hygienic sensor mounting BF-pms/A1. For example, pms-25/F... with Push-Pull switching output to count bottles.

Within the pharma industry

ampoules and glass vials have to be counted and the volume flow in the filling level process has to be controlled. On a turntable, a pms sensor controls the volume flow of glass vials ahead of the filling line. For example, pms-35/U... with voltage output 0–10 V.

Within the food industry

containers have to be counted or positioned, volume flow checked on conveyor belts, or food items have to be controlled on filling level and completeness. Two pms ultrasonic sensors monitor the completeness of apples in packaging boxes. For example, 2 x pms-25/F... each with Push-Pull switching output for height control.

pico⁺TF

The pico⁺TF sensors are ideal for the non-contact fill level measurement of chemically aggressive liquids or granules.

HIGHLIGHTS

- › PTFE membrane › for protection against aggressive media
- › M22 sleeve in PVDF
- › IO-Link interface › for support of new industry standard
- › Automatic synchronisation and multiplex operation › for simultaneous operation of up to ten sensors in close quarters
- › Improved temperature compensation › adjustment to working conditions within 120 seconds

BASICS

- › 1 Push-Pull switching output › pnp or npn basis
- › Analogue output 4–20 mA or 0–10 V
- › 4 detection ranges with a measurement range of 25 mm to 1,300 mm
- › microsonic Teach-in on pin 5
- › 0.069 mm resolution
- › 10–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

The pico+TF ultrasonic sensors

The compact dimensions of the pico+TF sensors makes them ideal for fill-level measurement in housings of restricted dimensions. The ultrasonic transformer is protected against aggressive media by a PTFE film. The exterior PVDF coating with its M22 x 1.5 external thread seals the ultrasonic transformer from the sensor housing. The M22 sensors detect in a contactless fashion and are reliable within a measuring range of 25 mm to 1,300 mm. The ultrasonic sensor is the best choice for non-contact fill level measurement with chemically aggressive liquids or granules. A typical application for these sensor line is the fill level monitoring of aggressive paints and inks such as those used in the digital printing sector. These inks often contain ketone. In addition to the high chemical resistance of the sensor, its size makes it especially suited to use in restricted spaces. Regular filling and emptying of the tank can produce wave motions in the tank system, which can be compensated using the internal filter setting.

For the pico+TF sensor family

there are two output stages and four detection ranges available:

-  1 Push-Pull switching output with pnp and npn switching technology
-  1 analogue output 4–20 mA or 0–10 V

Sensors with switching output have three operating modes:

- Single switching point
- Two-way reflective barrier
- Window mode

The pico+TF ultrasonic sensor continuously detects the fill level of liquids and granules

Teach-in of a single switching point

- Place object to be detected at the desired distance **1**.
- Apply $+U_B$ to pin 5 for about 3 seconds.
- Then apply $+U_B$ to pin 5 again for about 1 second.

Teach-in of a switching point

For configuration of a window

- Place object at the near edge of the window **1**.
- Apply $+U_B$ to pin 5 for about 3 seconds.
- Then move the object to the far edge of the window **2**.
- Then apply $+U_B$ to pin 5 again for about 1 seconds.

Teach-in of an analogue characteristic or a window with two switching points

NCC/NOC

and rising/falling analogue characteristic curve can also be set via pin 5.

One green and one yellow LED

indicate the state of the output and support microsonic Teach-in.

LinkControl

optionally permits the extensive parameterisation of pico+TF level sensors. The LCA-2 LinkControl adapter, which is available as an accessory, can be used to connect pico+TF sensors to the PC.

Sensor connected to the PC via LCA-2 for programming

Easy to synchronise

A number of pico+TF level sensors can be run closely packed in applications synchronised to stop them from influencing one another. To this end, the sync mode has to be activated and all the sensors are to be electrically connected one to another with pin 5.

Synchronisation via pin 5

IO-Link integrated

in version 1.1 for sensors with switching output.

crm⁺

Wear-resistant PEEK film protects the sensor membrane from chemicals, contamination and caking.

HIGHLIGHTS

- › Ultrasonic transducer protected by PEEK film › for simple cleaning and high resistance to wear
- › Stainless-steel housing
- › Digital display with direct measured value output in mm/cm or %
- › Numeric configuration of the sensor using digital display › permits the complete advance configuration of the sensor
- › Automatic synchronisation and multiplex operation › for simultaneous operation of up to ten sensors in close quarters

BASICS

- › 1 or 2 switching outputs in pnp variant
- › Analogue output 4–20 mA and 0–10 V › with automatic switching between current and voltage outputs
- › 5 detection ranges with a measurement range of 30 mm to 8 m
- › microsonic Teach-in by using button T1 or T2
- › 0.025 mm to 2.4 mm resolution
- › Temperature compensation
- › 9–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

TouchControl with LED display

Wear-resistant PEEK protective film

Sensor membrane with wear-resistant protective film

In many filling processes, spray on the sensor membrane simply cannot be avoided.

These sprays often harden so that after longer periods of operation contamination can only be removed from the sensor membrane by mechanical means.

The new protective film of the crm+ sensors now makes it easy to remove caked-on soiling, such as hardened casting compound and cement spatter. The protective film is also highly resistant to corrosive media. The threaded sleeve is made of 1.4571 stainless steel.

There are three output stages available

for all five detection ranges:

-  1 switching output in pnp switching technology
-  2 switching outputs in pnp switching technology
-  1 analogue output 4–20 mA and 0–10 V

The crm+ sensors with switching output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

With TouchControl

all configuration can be done right at the sensor. The easily legible three-digit LED display continually shows the current distance value and automatically switches between millimetre and centimetre displays.

Setting a switching or analogue output

can optionally be carried out by numeric input of the desired distance values, or using a Teach-in procedure. This permits the user to select the configuration method preferred. The crm+ sensors support synchronisation and multiplex operation and have extensive parameterisation options via LinkControl.

For detailed information, please see the chapter “mic+”.

LinkControl

consists of the LinkControl adapter and the LinkControl software and facilitates the configuration of the crm+ sensors via a PC or laptop with any conventional Windows® operating system.

Sensor connected to the PC via LCA-2 for programming

hps⁺

In protective housing – When you need chemical- and pressure-resistant sensors.

HIGHLIGHTS

- › Optionally used in normal pressure or overpressure
- › Teflon membrane › for protection against aggressive media
- › Stainless-steel or optional PVDF housing for hps⁺340 › for use in the food industry
- › Sealed against the housing with an O-ring made from FFKM › for the highest possible chemical resistance
- › Digital display with direct measured value output in mm/cm or %
- › Numeric configuration of the sensor using digital display

BASICS

- › 2 switching outputs in pnp variant
- › Analogue output plus 1 pnp switching output
- › 4 detection ranges with a measurement range of 30 mm to 8 m
- › microsonic Teach-in by using button T1 or T2
- › 0.025 mm to 2.4 mm resolution
- › Temperature compensation
- › 9–30 V operating voltage
- › LinkControl › for configuration of sensors from a PC

Fill level measurement in tanks

For fill level measurements of aggressive media and in overpressure

the ultrasonic transducers of the hps+ sensors are fitted out – as standard – with a Teflon film. It is sealed with a FFKM O-ring against the housing made of 1.4571 stainless steel or PVDF. This ensures a high degree of resistance to aggressive media.

The hps+ sensors can be used for fill level measurement under normal pressure or in tanks and containers with an overpressure of up to 6 bar. Its special software filters also allow its use in containers filled from above or that have a stirring system. Pressure-tight installation in a tank is undertaken by means of a 1" threaded flange or a 2" one in the case of hps+340.

Chemical resistance

and seal tightness were tested through being stored over cellulose thinner and 1,000,000 alternating pressure stresses. Cellulose thinner is extremely corrosive and has a high rate of penetration.

hps+340 in highly resistant PVDF housing

PTFE protective film sealed with an O-ring made from FFKM against the housing

Two different output stages

are available for four detection ranges:

2 switching outputs, in pnp switching technology

1 pnp switching output with an additional analogue output

The hps+ sensors with switching output have three operating modes:

- › Single switching point
- › Two-way reflective barrier
- › Window mode

Two three-colour LEDs

always show the current state of the switching outputs or the analogue output.

With TouchControl

all configuration can be done right at the sensor. The easily legible three-digit LED display continually shows the current distance value and automatically switches between millimetre and centimetre displays.

Setting a switching or analogue output

can optionally be carried out by numeric input of the desired distance values, or using a Teach-in procedure. This permits the user to select the configuration method preferred.

The hps+ sensors support synchronisation and multiplex operation and have extensive parameterisation options via LinkControl.

Further information on how to set up hps+ sensors can be found in the chapter "mic+".

LinkControl

consists of the LinkControl adapter and the LinkControl software and facilitates the configuration of the hps+ sensors via a PC or laptop with any conventional Windows® operating system.

Sensor connected to the PC via LCA-2 for programming

wms

The wms sensors are designed for use in microprocessor controllers with signal evaluation performed by customers.

HIGHLIGHTS

- › Trigger input › for control of the ultrasonic transmitter
- › Echo output › for customer-provided evaluation in the controller

BASICS

- › 1 echo output › with a load up to 10 mA
- › 5 detection ranges with a measurement range of 30 mm to 8 m
- › 0.36 mm resolution
- › 9–30 V operating voltage

The wms sensors

require a connection to the customer's own control and signal evaluation equipment.

wms – the inexpensive alternative

to a self-contained sensor when the sensor must be controlled by the customer's system. A microprocessor control is normally required for this.

The "transmitter" signal input

briefly has to be set to $-U_B$ by the control unit via an open-collector circuit. As a result, the wms sensor emits a sound pulse for the time of this signal.

The "echo" signal output

subsequently transmits all echo signals received depending on their duration as 1 bit values (echo yes/no). This takes between 8 and 65 ms depending on the type of sensor. The positive-switched (pnp) output can be loaded with 10 mA. The computation of the distance and subsequent processing is carried out in the customer's control system.

Our project engineers

will be happy to assist you in integrating a wms sensor into your control system.

Triggering a wms sensor from the customer's control system

transmitter input + echo output

dbk⁺4

The ultrasonic double-sheet control dbk⁺4 combines multiple variants of its predecessor into a single unit, opening up entirely new possibilities for use.

HIGHLIGHTS

- › 3 control inputs › for trigger, Teach-in and external sensitivity settings for the material
- › Teach-in option › e.g. for probing wafers stuck together by a water film
- › Variant with 90° angled head › for individual installation situations
- › Variant with external M18 receiving transducer
- › Variant with very compact transmitter and receiver in the M12 threaded sleeve

BASICS

- › Reliable detection of single and double sheets
- › No Teach-in needed (plug and play)
- › Double-sheet and missing-sheet output
- › Working distance between the transmitter and the receiver selectable from 20 mm to 60 mm
- › Trigger option › for applications in warehouse flow
- › LinkControl › for configuration of sensors from a PC

Functional principle

The task

of double-sheet control is to identify two or more pieces or sheets inadvertently adhering together.

The functional principle

A high-frequency ultrasonic transmitter beams against the sheet from the underside. The beamed signal induces the material to vibrate. The effect of these vibrations is a very small sonic wave on the other side of the sheet being spread. This wave is evaluated by the ultrasonic receiver on the opposite side. The signal from the stacked sheet ("double sheet") is so weak that it hardly gets to the receiver.

The working ranges

The dbk+4 has three control inputs by means of which three working ranges can be preselected. The standard working ranges covers the sheet material weight range from 20 g/m² to 1,200 g/m². Extremely thin materials such as Bible printing paper with a weight per unit area of less than 20 g/m² are scanned with the use of the "Thin" setting. The "Thick" setting is available for paperboard containers and fine-corrugated card.

Changes between the working ranges can be undertaken under on-going operations. A Teach-in for the material to be scanned is not necessary.

If the three control inputs stay unconnected, then the dbk+4 operates in the standard working range. As such, a very broad material spectrum can be scanned.

Teach-in

The Teach-in function is additionally available for materials which cannot be scanned with one of the three working ranges.

A material Teach-in is done by inserting a single sheet into the double-sheet control. The C3 control input is then applied to logic 1 level for at least 3 seconds. Materials with non-homogeneous elements must be moved during the Teach-in phase so that the dbk+4 can detect them. Success with a Teach-in operation is shown by a green LED. The material can now be detected. The Teach-in makes it possible to scan materials from thin Washi to wafers glued with a water film.

Range of uses of dbk+4:

- › Sheet-printing machines
- › Assembly machines
- › Folding machines
- › Paper-processing machines
- › Manufacturing of solar cells and silicon wafers
- › Labelling
- › PCB manufacturing

Paper

Film

Sheet metal

Double-sheet control

Fine-corrugated card can be optimally detected at an inclination of $\alpha \geq 35^\circ$, thin sheet metal or thicker plastic films at 27° and wafers at an angle of 11°

The mounting

The recommended spacing between transmitter and receiver is 40 mm (or 20 mm with dbk+4/M12/3CDD/M18 E+S).

If needed, this spacing can be adapted to the local conditions in the 20 mm to 60 mm range. For the matter of commissioning, this can be done by means of a simple Teach-in or with the LinkControl parameterisation software.

Material-conditioned fitting position

With papers and thin films, the double-sheet control is operated perpendicularly to the material; flapping does not impair the function.

In the case of fine-corrugated card, thin sheet metal, wafers or thicker plastic films (e. g. credit cards), the dbk+4 should be mounted at a specific angle of inclination to the material running through.

The free-run mode

The dbk+4 operates as standard in the free-run mode. This means that the dbk+4 cyclically carries out measurements at a high measuring rate.

Under ongoing operations, the working range can be changed and a Teach-in carried out by means of the C1 to C3 control inputs.

	C1	C2	C3
Standard	0	0	0
Thick	0	1	0
Thin	1	0	0
Teach mode	1	1	0
Teach-in	1	1	1

Free-run mode – selection of the working range

The trigger mode

Should, on the other hand, measurements be undertaken in applications with continuous feed, then an external trigger signal can trigger a measurement.

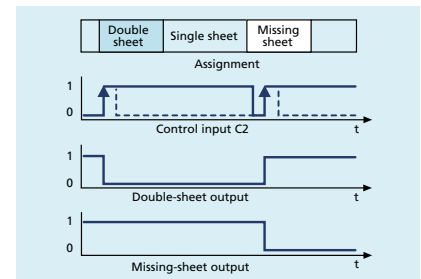

This function is parameterised with the aid of the LinkControl software. A choice can be made between edge trigger and level trigger.

The C2 control input then assumes the function of the trigger input (tr).

	C1	C2	C3
Standard	0	tr	0
Thin	0	tr	1
Teach mode	1	tr	0
Teach-in	1	tr	1

Trigger mode – selection of the working range

Under ongoing operations, the working range can be changed by means of the C3 control input.

Trigger mode – edge-controlled

Trigger mode – level-controlled

Support through LinkControl

dbk+4 can be comprehensively parameterised with the aid of the LinkControl software. To this end, the dbk+4 is connected to the LCA-2 LinkControl adapter. Using the LinkControl software, a USB cable connects the LCA-2 to the PC.

The following parameters can be individually adapted:

- › Spacing between transmitter and receiver
- › Double sheet: NOC/NCC
- › Single sheet or missing sheet: NOC/NCC
- › Trigger mode: on/off
- › Edge-controlled trigger: falling/rising edge
- › Level-controlled trigger: high/low active
- › Switch-on delay for detecting double sheet
- › Switch-off delay for detecting double sheet
- › Threshold values for the working ranges

The LinkControl adapter LCA-2

The four variants

Four housing variants cover all imaginable fitting positions.

dbk⁺5

Extends the area of application of double-sheet controls to heavy carton, corrugated cardboard and plastic sheets.

HIGHLIGHTS

- › High-performance ultrasonic double-sheet control › especially for the probing of corrugated cardboard as well as plastic plates several mm thick
- › 3 control inputs › for trigger, Teach-in, and external sensitivity settings for the material
- › Teach-in option › e.g. for probing plates stuck together with an oil film
- › Compact design in M18 x 1 threaded tube

BASICS

- › Reliable detection of single and double sheets
- › No Teach-in needed (plug and play)
- › Double-sheet and missing-sheet output
- › Working distance between the transmitter and the receiver selectable from 30 mm to 70 mm
- › Trigger option › for applications in warehouse flow
- › LinkControl › for configuration of sensors from a PC

The dbk⁺5 ultrasonic double-sheet control

is designed for scanning thin sheet metal, plastic sheets and corrugated cardboard with thicknesses exceeding the working range of the dbk⁺4 sensors. The principle behind the operation is the same as for the dbk⁺4 sensors. The main difference between the systems lies in the materials to be detected. (For further information, see dbk⁺4.)

Typical materials

in the range of applications of the dbk⁺5 are sheet metal up to approx. 2 mm thick (depending on the type of metal), plastic sheets and boards for printed circuits up to a thickness of several millimetres, and coarse, corrugated card.

Papers require the sensors to be mounted perpendicular to the passing sheets. But in the case of sheet metal, plastic sheets and boards for printed circuits, it is preferable to mount the dbk⁺5 at an angle of 10–18° to the passing sheets. The optimum angle should be determined by way of trials. Corrugated cards should be scanned at an angle of 35–45° to the corrugations.

Transmitter and receiver

are housed in M18 x 1 mm threaded sleeves which should be mounted from 30 mm to 70 mm apart.

esp-4

Label and splice sensor compact in a single unit, optionally with M12 sensor head.

HIGHLIGHTS

- › 3 Teach-in methods › to be able to configure the sensor individually for any task
- › Response time < 300 μ s › for use at high web and label speeds
- › Splice detection even for thick band materials
- › Variant with very compact transmitter and receiver in the M12 threaded sleeve

BASICS

- › Label and splice sensor in a single unit
- › 2 switching outputs › for label/splice detection and web break monitoring
- › LinkControl › as optional assistance for installation and commissioning

esp-4 – one unit for all cases: label and splice sensor in one appliance

With a rapid pulse sequence, an ultrasonic transmitter beams upwards against the backing material. The effect of the sound pulses inducing the backing material to vibrate is for a markedly weakened sonic wave to be emitted on the opposite side.

The receiver receives this sonic wave and analyses it. The backing material signal level is different to that of the label or splice. And this difference in signal is analysed by the esp-4. The difference between backing material and a label or between sheeting and splice can be very slight indeed. In order to differentiate, the esp-4 sensor has to learn the signal level for the backing material or sheeting.

Backing material with label provides an attenuated signal level

The esp-4 sensors can be used as a label and splice sensor. The three Teach-in methods permit the esp-4 sensor to be optimally set for each and every assignment.

A) Dynamic Teach-in of backing material and label

During Teach-in, the backing material with the labels is led at a constant speed through the esp-4 sensor.

The esp-4 sensor automatically learns signal levels for the labels and for the gaps between them.

This Teach-in method is also suitable for Teach-in of a tear-open string on a cellophane film. Here, during Teach-in, the tear-open string on the cellophane film is moved a number of times through the sensor. This enables the esp-4 to gauge the changing between cellophane film and tear-open string.

esp-4 as label sensor

esp-4 as thread sensor

B) Separate Teach-in for backing material and labels

The signal level difference for the backing material and labels might be very slight. In order to still scan labels with very little difference in signals, Teach-in for the signal levels is done separately: Teach-in is first done for the backing material and then for

the label on it. The switching threshold then lies between these two signal levels.

C) Learn sheeting only

Sheeting is usually processed from the roll. Then the splice to be detected for setting the esp-4 is somewhere inaccessible in this roll. A separate Teach-in method is available here in which the Teach-in only applies to the sheeting. The esp-4 detects the splice from this difference in sound level and sets its output.

esp-4 as splice sensor

Two housing designs with different ultrasonic frequencies

The esp-4/3CDD/M18 E+S as a receiving transducer integrated directly into the evaluation electronics is typically used for the detection of splices in thick sheeting.

The esp-4/M12/3CDD/M18 E+S has an external receiving transducer. The transmitter and receiver are each housed in M12 threaded sleeves. The variant with M12 sensor heads is preferred for the detection of labels.

With LinkControl

the esp-4 can optionally be parameterised. Measured values can also be shown graphically.

esf-1

The esf-1 fork sensor can detect labels reliably even at high label speeds.

HIGHLIGHTS

- › 3 Teach-in methods › for the detection of labels even outside the standard
- › Response time $< 300 \mu\text{s}$ › for use at high web speeds
- › Housing in fork format with very compact dimensions
- › QuickTeach
- › IO-Link interface › for support of the new industry standard

BASICS

- › Label and splice sensor as a fork sensor
- › 2 switching outputs › for label/splice detection and web break monitoring
- › 3 LEDs and 1 button on the top of the housing
- › Teach-in optionally via button or pin 5
- › LinkControl › as optional assistance for installation and commissioning

The functional principle

Labels are guided through the fork. An ultrasonic transmitter in the lower leg of the fork beams a fast sequence of pulses through the backing material. The sound pulses cause the backing material to vibrate such that a greatly attenuated sound wave is beamed from the opposite side. The receiver in the upper leg of the fork receives this sound wave.

The backing material transmits a different signal level from the label. This signal difference is evaluated by the esf-1. The signal difference between the backing material and the label can be very slight. To ensure a reliable distinction, the esf-1 has to learn the label.

Backing material with a label provides an attenuated signal level.

The esf-1

can be used as a label sensor or as a splice sensor. With its three Teach-in methods or QuickTeach, the esf-1 sensor can be optimally adjusted to any task configuration.

A) Learn both backing material and label dynamically

During the Teach-in process, the backing material and its labels are guided through the fork at a constant speed.

The esf-1 sensor automatically learns the signal level for the labels and for the gaps between the labels.

This is the standard Teach-in for labels.

esf-1 as label sensor

B) Separate Teach-in for backing material and labels

The signal level difference for the backing material and labels might be very slight. In order to still scan labels with very little difference in signals, Teach-in for the signal levels is done separately: Teach-in is first done for the backing material and then for the label on it. The switching threshold then lies between these two signal levels.

C) Learn sheeting only

Web material is generally processed from a roll. The splice to be detected is hidden somewhere in the roll. There is a separate Teach-in method available for this purpose, in which only the sheeting is learned. The esf-1 detects the level difference at the splice and sets its output.

esf-1 as splice sensor

The Teach-in procedure

can optionally be carried out with the button on the top of the housing or with pin 5 on the unit's connector.

For QuickTeach

the esf-1 learns the material for the duration that the button is pushed or pin 5 is controlled.

With LinkControl

the esf-1 can optionally be parameterised. Measured values can also be shown graphically.

Labels are guided through the fork. The esf-1 reacts to the signal difference between the backing material and the label.

IO-Link

esf ultrasonic label and splice sensors have a Push-Pull switching output and support IO-Link in version 1.1.1.

bks⁺

Edge sensor with a wide working range for contact-free web edge detection of foils, paper and other noise-absorbing materials.

HIGHLIGHTS

- › Housing designs › with 30 mm and 60 mm fork width
- › Available in 12 mm or 40 mm measurement range
- › IO-Link interface › for support of the new industry standard
- › 0.01 mm to 0.02 mm resolution
- › Very compact housing dimensions

BASICS

- › Contact-free detection of the path edge › for regulation of the web path
- › Analogue outputs 4–20 mA and 0–10 V › switchable between current and voltage outputs
- › 3 LEDs and 1 button on the top of the housing
- › Parameterisable with LinkControl
- › Robust metal housing

The bks⁺ ultrasonic edge sensors

are an advanced development of the edge sensor bks-3/CIU. The bks⁺ edge sensors have a much wider working range at 12 mm or 40 mm. In addition to an analogue output 4–20 mA and 0–10 V, there is an additional switching output with IO-Link available.

The functional principle

Both transducer and receiver are placed in a single, slim fork housing. The transducer in the lower leg emits short, cyclical sound pulses. These are detected by the ultrasonic receiver in the upper leg of the fork. A material embedded in the fork covers the sound gap and thereby dampens the receiving signal depending on the coverage. This is analysed by internal electronics.

An analogue signal is output depending on the degree of coverage, resp. data word via IO-Link.

1 Push-Pull switching output in pnp and npn switching technology and 1 analogue output 4–20 mA or 0–10 V

The working range for the bks+3/FIU is 12 mm and for the bks+6/FIU is 40 mm.

Using the Teach-in button

on the upper side of the edge sensor sets the zero point for the local edge. This calibration can be done in two ways:

- Clear the fork completely of any web material,
 - push the button for approx. 3 seconds,
 - cover the fork sensor completely and push the button briefly (< 1 s). Ready.
- Or
- adjust the path edge within the fork to both markings so that 50% of the sound gap is covered,
 - then push the button for approx. 6 seconds.

The edge sensor bks+3/FIU has a fork width of 30 mm and a fork depth of 43 mm. The edge sensor bks+6/FIU has a fork width of 60 mm and a fork depth of 73 mm. There are two through bores to mount edge sensors in the side of the housing. The electrical connection is via an M12 circular plug.

Three LEDs

show the position of the web material within the fork. When using light-sensitive materials, the LEDs can be switched off.

Ultrasonic edge sensors sample the edge of audio-signal-absorbing materials such as foils or paper. They are especially suited to web path control of high-transparency foils, light-sensitive materials or materials with greatly varying transparency.

Switching over

between current and voltage outputs is done by using the button or LinkControl. The bks⁺ is preset and can be used immediately. Optionally it can also be comprehensively parameterised using the LinkControl adapter LCA-2 (see the chapter “Accessories”).

IO-Link in version 1.1

is integrated as standard. Further information about the IO-Link can be found in the chapter “Functions and advantages: IO-Link in detail”.

1 Push-Pull and 1 analogue output

1 Push-Pull and 1 analogue output

bks

The bks edge sensor facilitates the contact-free web edge scanning of foils, paper and other sound-impermeable materials.

HIGHLIGHTS

- › Compact design with only 30 mm fork width
- › 0.025 mm resolution
- › 0.1 mm relative accuracy
- › 4 ms response time
- › 8 mm working range

BASICS

- › Contact-free detection of the path edge
- › Analogue output 4–20 mA and 0–10 V
- › 3 LEDs and 1 button on the top of the housing
- › Parameterisable with LinkControl
- › Robust metal housing › for harsh usage conditions

The bks ultrasonic edge sensor

is a fork sensor for scanning the edges of sound-impermeable materials such as foil or paper.

This is why the bks is ideally suited for the web control of highly transparent foils, light-sensitive materials, materials with greatly varying transparency and paper subject to high paper dust loads.

The functional principle

The fork's lower leg is equipped with an ultrasonic transmitter which cyclically emits short sound impulses, which are detected by the ultrasonic receiver arranged in the upper fork leg. Material passing through the fork covers this sound path and thus attenuates the receiving signal depending on the coverage, which is evaluated by the internal electronics.

An analogue signal is output depending on the degree of coverage.

 The analogue output can both deliver voltage 0–10 V as well as current 4–20 mA.

The operating range amounts to 8 mm (± 4 mm).

Via the Teach-in button

on the edge sensor's top, the zero position of the edge to be controlled is set.

There are two options for calibration:

- completely freeing the fork from the sheeting,
- pressing the button for approx. 3 seconds until the two yellow LEDs flash alternately. Ready.

Or

- aligning the web edge inside the fork with the two marks to ensure a 50% coverage of the sound path,
- then pressing the button for approx. 10 seconds until the two yellow LEDs remain lit. Ready.

The bks edge sensor has a fork width of 30 mm and a fork depth of 33 mm. Other fork widths and depths are available upon request.

The housing side is equipped with two consistent bores for the edge sensor's mounting. The electrical connection is established via an M12 circular connector.

Three LEDs

indicate the position of the sheeting inside the fork. For use with light-sensitive materials, the LEDs can also be switched off.

The bks is preset and immediately ready for operation. Optionally, it can also be comprehensively parameterised with the help of the LinkControl adapter LCA-2 and LinkControl software (see the chapter "Accessories").

With a fork width of only 30 mm and a depth of 33 mm, it has a very compact design. Its working range of 8 mm and its high accuracy of 0.1 mm permit a wide variety of applications.

eWS

Ultrasonic through-beam sensor in different housings.

HIGHLIGHTS

- › Transmitter and receiver › in miniature cubic or M18 housing
- › Installation-compatible with many light barriers › a true alternative for critical applications
- › Up to 500 Hz switching frequency › for fast sampling

BASICS

- › 1 switching output in pnp variant
- › microsonic Teach-in using a button
- › Working distance between the transmitter and the receiver selectable from 10 to 2,500 mm
- › 20–30 V operating voltage

Ultrasonic through-beam barrier ews

for contact-free detection of objects specially in the most diverse applications e.g. with bottles or plastic foils. The through-beam sensor ews is available as a cuboid miniature housing and a cylindrical M18 housing. The ews family covers a working range of 10 mm to 2,500 mm.

A through-beam barrier

consists of two constructively-identical units which are operated as a transmitter and a receiver. The two units recognize whether they are intended to work as a transmitter or a receiver via the control input. If pin 2 +U_B is activated, this unit functions as a transmitter.

The functional principle ultrasonic through-beam barrier

The functional principle

one through-beam sensor ews, set as transmitter, sends cyclic sound impulses, received by another one, set as receiver. If an object interrupts the pulses between the transmitter and the receiver, the switching output of the receiver is set.

microsonic Teach-in

The Teach-in button on the top of the cubic through-beam barrier ews-15/CD allows for a convenient configuration of the response time and the output function of the switching output of the receiver. With the Teach-in procedure the response time and an off-delay of 6.9 ms can be set. At the through-beam barrier in the M18 housing, response time and output function can be set via the Teach-in procedure at pin 2.

Two LEDs

show the operating state and the state of the switching output of the receiver.

LCA-2

The LCA-2 facilitates the convenient setting of numerous microsonic sensor series ("nice to have").

HIGHLIGHTS

- › Three-digit digital display › for the display of measured distance values in mm or cm
- › TeachBox with four-button operation › for programming of the sensor without a PC
- › LinkCopy function › for copying the sensor settings from one sensor to another without a PC
- › Uniform microsonic Teach-in for all microsonic sensors › to keep easy things easy

BASICS

- › Handy adapter › for the programming of ultrasonic sensors
- › USB interface › for connecting to a PC
- › T plug › to insert the adapter between the connector cable and the sensor
- › LinkControl software › free download of the current version available on the Internet
- › Backwards-compatible › so sensors that have been in the field for a long time can still be programmed
- › Future-proof › since the LinkControl adapter will also support future generations of sensors

The LinkControl adapter LCA-2

is equipped with a USB interface for connecting to a PC or laptop.

With the LinkControl software

the ultrasonic sensors of the mic⁺, mic, pico⁺, lpc⁺, lcs⁺, lcs, ucs, pico⁺TF, crm⁺, hps⁺, pms, bks⁺, bks, dbk⁺, esp and esf series can be parameterised under Windows®.

LinkControl software: input mask

The current measurement values

of the ultrasonic sensors can be graphically visualised with the LinkControl software in the form of three different output graphics.

LinkControl software: measurement plotter

The LinkCopy function

allows parameters to be downloaded from the sensor to the LCA-2 and the subsequent upload of these parameters

to a different sensor. This way, sensor settings can be conveniently copied from one sensor to another.

Offline programming within LinkCopy

With some sensor series, the sensor settings copied to the LCA-2 can be directly indicated and edited via the digital display before being written back into a sensor.

For the LinkCopy function, the LinkControl adapter need not be connected to a PC. The LCA-2 reads the parameters out of the sensor and saves them internally to its EEPROM. The data are thus safely stored in the LinkControl adapter even after disconnecting the power supply and can consequently also be used as a sensor setting archive.

Via the integrated TeachBox,

all ultrasonic sensors which are taught via pin 5 at the sensor plug (mic, pico⁺, lpc, lcs and esf-1) can be conveniently set. The Link-Control adapter LCA-2 is looped between the sensor connection line and the sensor; a PC or laptop is not required. During the Teach-in process via buttons T1 and T2, the length of the button stroke is indicated in seconds on the display.

USB interface for PC connection

LinkCopy: copying of sensor settings

The TeachBox Functions	
T1	Press T1 to teach switched output D1 or the analogue output
T2	Press T2 to teach switched output D2
F T1	Press F + T1 to load sensor parameters from LCA-2 to the sensor (upload)
F T2	Press F + T2 to load sensor parameters from the sensor to the LCA-2 (download)
F	Press F to show measured values indicated in mm/cm on the digital display
R	Press R (reset) to restart the sensor (for upload, download and measurement value output)

The TeachBox

SoundPipe zws1

Attachment dome for zws-15 and zws-7 sensors

SoundPipe sks1

Attachment dome for sks sensors

UF-90/M30

Beam deflector for ultrasonic sensors with up to 1.3 m operating range in M30x1.5 threaded sleeves

UF-90/M18

Beam deflector for ultrasonic sensors with up to 0.35 m operating range in M18x1 threaded sleeves

BF-30

Fastening clamp for sensors with M30 threaded sleeve, material PA

BF-18

Fastening clamp for sensors with M18 threaded sleeve, material PA

G1_G1/2 reducer piece

For mounting of hps+25 sensors with G1 process connection in an existing G1/2 hole

SyncBox1

For the external synchronisation of more than ten mic+ sensors: approx. 160 mic+ sensors can be synchronised

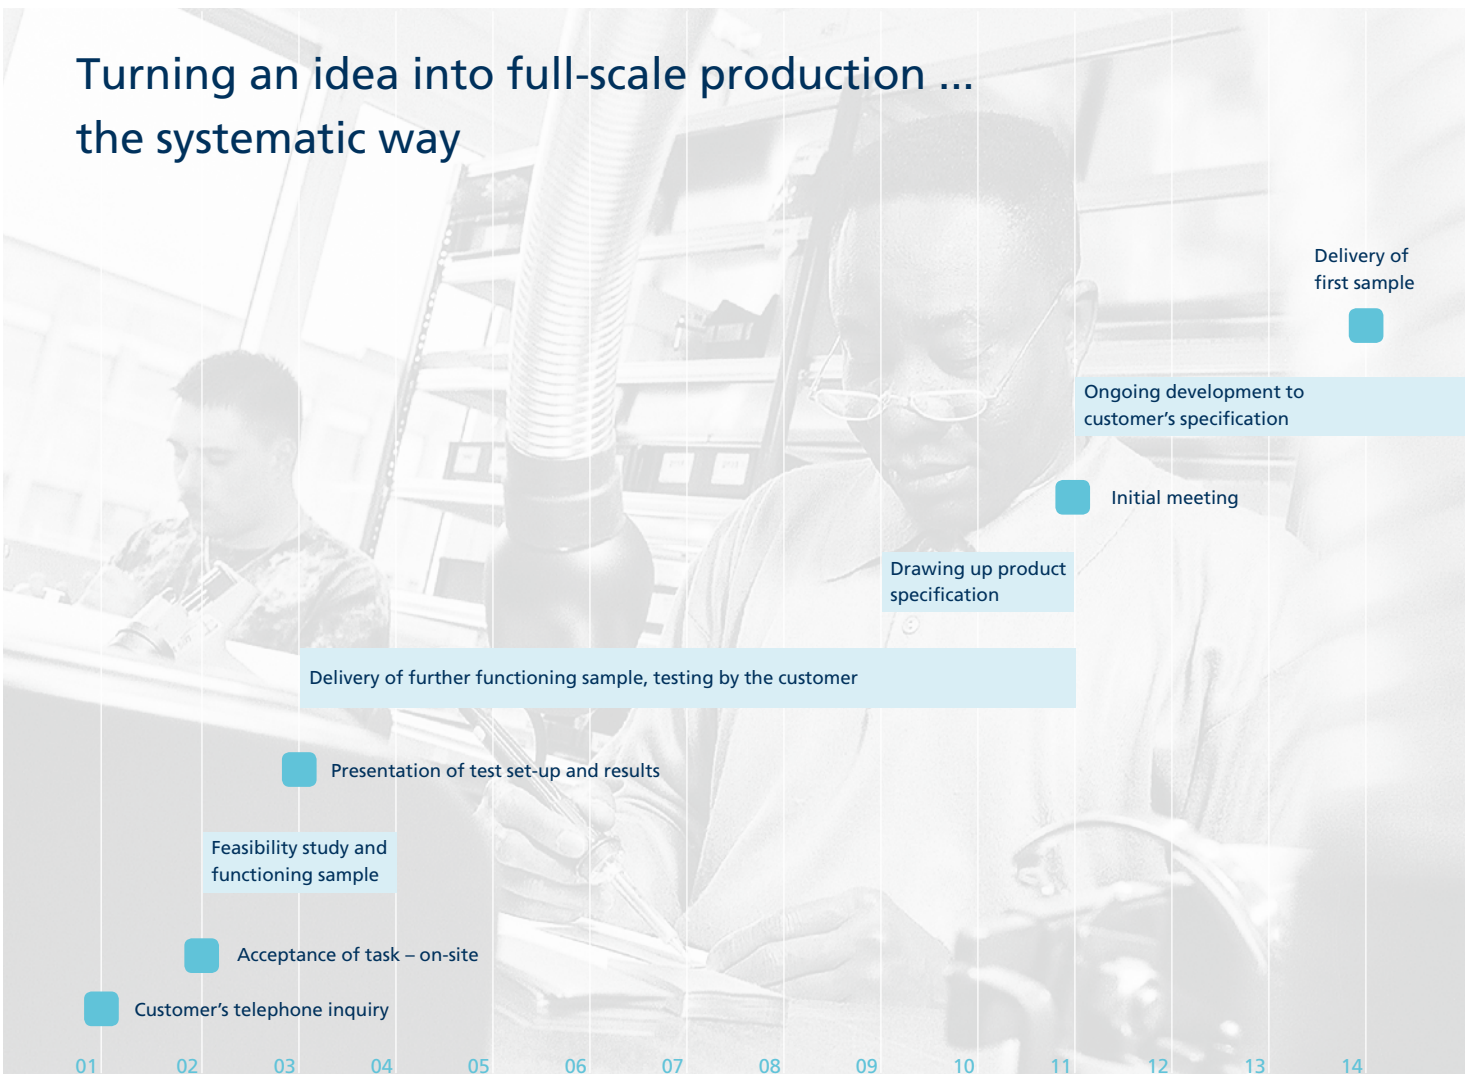

SyncBox2

For the external synchronisation of zws sensors: about 50 zws sensors can be synchronised

Turning an idea into full-scale production ... the systematic way

“Is everything that is conceivable also technically feasible?”

microsonic prefers to answer this question by way of practical examples. What that means is together with you, in a constant exchange and directly on-site. The development of solutions to customers' specifications for special applications, requirements or installations is quite often technical necessity – and at the same time the expression of what we at microsonic understand as “focusing on the customer”.

The starting point for an individual development can be an inquiry about a different, tailor-made housing for a sensor,

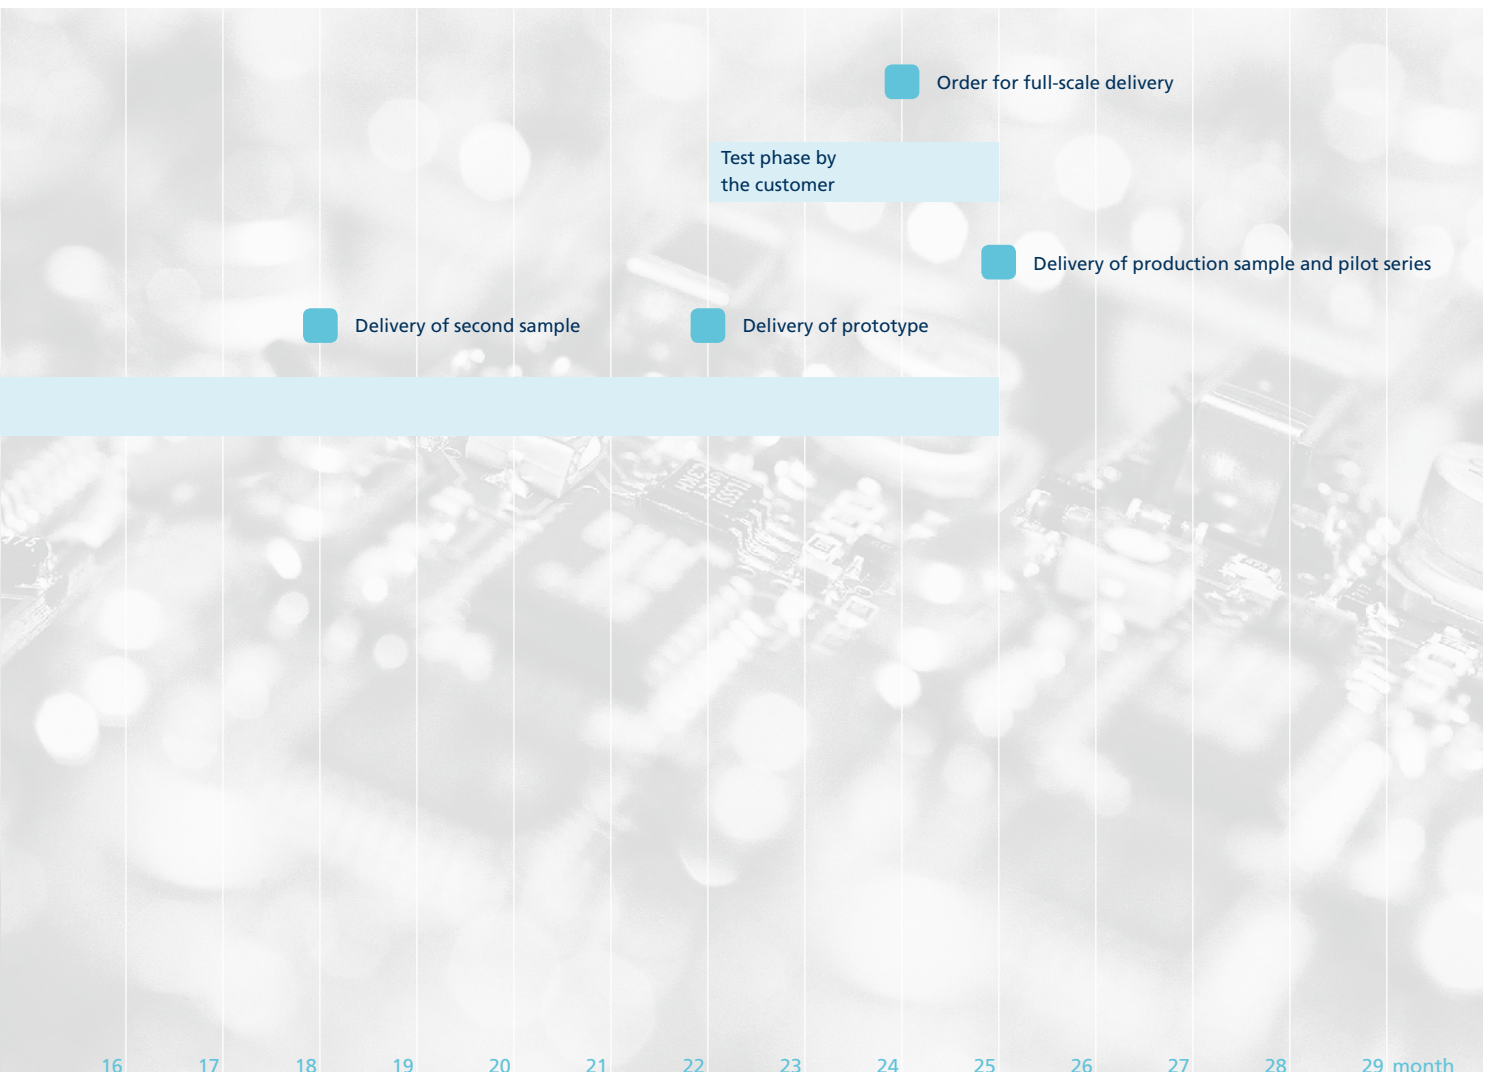

modified output signal or evaluation logic that must be altered because in its present form it does not fit with your specific conditions or design.

And there is also the case where you wish to know whether it is even possible to solve your task with an ultrasonic sensor at all. We are happy to answer this question, too. To realise your ideas and conceptions, we follow a systematic path. First, we analyse your particular task or problem and the technical options, and then show you specific solutions.

In this way, we can clarify right at

the outset which sensor or which system is the most cost-effective – and hence profitable – for your application. From the prototype to large-scale production, you are always involved and kept well informed.

So, put us to the test! We look forward to your inquiry.

Across the globe, competent staff and sales partners are available to help you.
